New Meter Report for RWD2 Customers

(November 2026)

We are very happy to report the new meters are already paying off in terms of identifying leaks promptly for our customers! Over 30 customers have been identified as having some type of leak on their side of the meter. Some were as low as 2 gallons per hour while others were more than 50 gallons per hour! Receiving continuous flow alerts in the office is a very helpful aspect of the new meter technology. Many leaks have been repaired!

This is also an opportune moment for RWD2 to recommend checking those toilet flappers and tanks for possible leaks, as a toilet can lose 1 to over 115 gallons per hour depending on whether the leak is constant. Be sure to check your faucets when you disconnect your hoses before temperatures drop.

If you are interested in learning about RWD2's new capabilities, please share your email and feel free to request a water usage report where you can reconcile your water use and see your hourly consumption. This is much better than the previous 1 read/month method that still did not provide the hourly water usage.

Thanks so much for being a Rural Water District #2 Member!
